The thing with solar panels is that the voltage sags a lot under load. They're usually rated for open circuit voltage, i.e. with no load. To get maximum power out of a solar panel you will need an MPPT (maximum power point tracking) circuit, which automatically adjusts the current it draws from the panel to optimize the power (which is, of course, the product of the current and the ???

The first place to start is to estimate or measure your current draw. That's what will determine the needed size of the solar panel. You need to add enough juice during the day to power the thing through the night, and I think you'll want to "oversize" the panel to keep the batteries topped up almost all the time, as opposed to running dead once in a while in cloudy ???
