Should I buy a Power Mac G5?

If the price is cheap enough and you already have a Power Mac G5, this could be the least expensive way to max out system memory - or migrate to a whole new machine simply by moving your hard drive to your acquisition. There's a lot of power for the money in these, especially the dual-processor and dual-core models.

What is the Power Macintosh G5 quad core?

The Power Macintosh G5 "Quad Core" (2.5) uses the same easy-to-upgrade "anodized aluminum alloy" case as all other Power Macintosh G5 models with the same removable side panel for easy access to internal components. Likewise,it is divided into four different thermal zones with nine computer-controlled fans for optimum cooling.

What is a dual core Macintosh G5?

The Power Macintosh G5 "Quad Core" (2.5), along with the Power Macintosh G5 Dual Core (2.0) and Power Macintosh G5 Dual Core (2.3), are the first and last Power Macintosh G5 models to use dual core PowerPC 970MP (G5) processors, which have two independent processor "cores" on a single silicon chip.

What is a Power Mac G5?

All models pack 64-bit PowerPC 970(G5) processors in an easy-to-upgrade aluminum tower case design with a single external optical drive bay. Aluminum tower Macs with dual optical drive bays are Mac Pro models. Complete Power Macintosh G5 technical specs are below. For answers to all your Power Mac G5 questions,see the Power Macintosh G5 Q&A.

When did the Power Mac G5 come out?

Well, until the dual-core models shipped in October 2005, which we will mostly ignore in this article. The Power Mac G5 was the first Power Mac with built-in USB 2.0 (3 ports), so that was one less add-in card for Power Mac users to buy. It also has FireWire 400 (2 ports) and 800 (1 port), which only the January 2003 Power Mac G4 had.

How much memory does a Power Mac G5 use?

With the Power Mac G5,Apple greatly simplified things. The 1.6 GHz Power Mac G5 uses the same PC-2700memory as the fastest G4 Power Macs. All of the other pre-dual-core models use PC-3200 memory,making it easy to mix and match memory modules among machines. Except for the 1.6 GHz model and the Late 2005 models,they all use PC-3200 memory.

I have a question about my Dual Core 2GHz Power Mac G5 (Late 2005). Currently, it's disassembled and I have the choice of installing either a 2GHz CPU board or a 2.3GHz CPU board. The 2.3GHz (native) system has a 1.15GHz frontside system bus while the one in my system is clocked at 1GHz.

About This Power Mac. The Power Mac G5 Dual Core (2.0) is powered by a single "dual-core" 2.0 GHz PowerPC 970MP (G5) processor and is also one of the first across all manufacturers to employ 64-bit processors Desktop line. ???
