For a typical plant containing power factor correction capacitors, the resonant frequency (frequency at which amplification occurs) normally falls in the vicinity of the 5 th to the 13 th harmonic.. Because nonlinear loads typically inject currents at the 5 th, 7 th, 11 th, and 13 th harmonics, a resonant or near-resonant condition will often result if drives and capacitors are ???

capacitors of equal value are wired in series, they become the equivalent of a single capacitor of half their individual values, but now can tolerate twice the working voltage of the individual capacitors. However, real capacitors, especially electrolytic capacitors like C3 and C4 also exhibit leakage currents which can be significant.
