Problem with Sears Craftsman Lithium-Ion 16V battery packs. I bought two 16V Sears Craftsman Professional Li-Ion drills a couple of years back at different times. One was the 320.29036 with a 320.29006 battery pack and the other was a 320.10320 with a 320.11208 battery pack. Also got a 320.10321 Universal charger.

Basically that works for every brands that has adopted "the 20v battery Strategy", I mentioned dewalt just cause its the brand that I use, 20v nominal batteries are practically 18v. Inside the battery, no matter if it is rated 18v or 20v, there are always 5 batteries 3.5v each, ($3.5 \times 5 = 17.5$) 18v, exp for "entry level" 1.5 - 2a battery.

Hello, Last evening, my Craftsman C3 drill caught on fire. Several sparks and a lot of smoke pouring out of the rear vents near the level. Only had the drill for 2 years, only ever saw light weekend use. The smoke was awful, full of phenolics and other plastic vapors, - nasty. My 19.2V battery is going strong, but this C3 drill is definitely shot.

Hi Guys, The electronics package on my Sears radial arm saw recently went south. After cleaning up the battery box, replacing the battery and setting the points of reference for the miter, bevel and elevation, when I make an adjustment to that setting, the display still reads zero. It's like the electronics are not seeing the encoders.

Cordless drill, charger, 2 battery packs, and carrying bag for \$69. The problem is that these companies are so proud of their crap and their name that they think we sheep are going to buy their replacement batteries at any cost (or at ???

CRAFTSMAN C3 LITHIUM BATTERY

He saw this at Home Depot, bare tool for \$299. and get a free battery: Milwaukee M18 FUEL 18-Volt Lithium-Ion Brushless Cordless Gen II 18-Gauge Brad Nailer (Tool-Only) 2746-20 - The Home Depot The MILWAUKEE M18 FUEL 18ga Brad Nailer delivers peak productivity at the jobsite, providing users with unmatched nailing performance without the hassle

Craftsman C3 19.2 volt Work Light (item #00911391000) About March 27, the battery pack indicated that it needed to be charged. I placed it in the charger. The charger ran through the charging sequence, but, when it indicated that the pack was charging, the indicator switched to full charged in about 30 seconds.

I've had my C3 stuff for a while (since before the 19.2v was called C3) and no issues with the chargers or batteries. I've heard that if you go right from a hot battery (if, say you were driving lots of screws or lags) to the charger right away the batteries show up as defective. If you let them cool for a while first, they supposedly charge

I just purchased a Craftsman 1/2" drill/driver that includes a model 315.CG2021 charger and a model 315.PP2011 lithium-ion battery. I have had the battery plugged into the charger for 15 hours and the charging indicator light is still flashing, indicating that the battery is still being charged.
