6 ? In particular, the Yucatan Peninsula, located in the southeastern region of Mexico, generates electricity mainly from natural gas [5]. Although recent studies have shown the potential for offshore wind generation [6], no studies have addressed the integration of these renewable sources into the electrical network in that region Ref. [7], the authors examine spatial and ???

Integrated Solar Combined Cycles are a specialized adaptation of solar power plants designed to harness solar thermal energy for direct power generation. Integrating solar energy into a combined cycle infrastructure increases power output while maintaining constant primary fuel consumption .

This paper evaluates the impact of changes in Mexican energy policies on the Mexican innovation systems ability to support renewable energy technologies, through a comparative case study on geothermal and solar photovoltaic technologies.

Nos referimos a la energía solar térmica o calor solar, que, en esencia, captura la generación solar para transformarla en calor para los procesos de calentamiento de fluidos, como agua, aceites e incluso aire.

Solar power in Mexico has the potential to produce vast amounts of energy. 70% of the country has an insolation of greater than 4.5 kWh/m<sup>2</sup>/day. Using 15% efficient photovoltaics, a square 25 km (16 mi) on each side in the state of Chihuahua or the Sonoran Desert (0.01% of Mexico) could supply all of Mexico's electricity.
