

What can you see in the night sky?

The night sky tonight and on any clear night offers an ever-changing display of fascinating objects you can see, from stars and constellations to bright planets, the moon, and sometimes special events like meteor showers.

How do you see the Moon at night?

So if you have binoculars or a small telescope, you can look periodically over the course of the night as the Moon crosses directly in front of the bright star cluster. On the 23rd, the Moon rises in the late evening hours with giant Jupiter. They climb high into the southeast sky as dawn approaches.

Where does the Moon go after sunset?

In the southwestern sky for a short period after sunset on Saturday, Oct. 5, the slender crescent of the young moon will shine several finger-widths to the lower left (or celestial south) of the very bright planet Venus. (Image credit: Chris Vaughan/Starry Night)

Where is the Moon in the sky on September 24?

Sky chart showing The Moon near Jupiter in the morning sky before sunrise on September 24, along with some of the well-known (Northern Hemisphere) winter stars and constellations. Credit: NASA/JPL-Caltech

When is the waning gibbous moon on 'Starry Night'?

Around mid-evening on Sunday, Oct. 20, the bright, waning gibbous moon will rise in the east with brilliant Jupiter shining a palm's width to its lower right (or 6 degrees to its celestial southwest). (Image credit: Chris Vaughan/Starry Night)

Does the Moon pass through the Pleiades?

And this is kind of a special pairing if you're in the U.S., as the Moon will actually pass right through the Pleiades over the course of the night. So if you have binoculars or a small telescope, you can look periodically over the course of the night as the Moon crosses directly in front of the bright star cluster.

October 17 - Full moon; October 20 - The Moon rises near Jupiter, with the giant planet looking extremely bright. You should be able to find them low in the east after around 10 pm. October 23-24 - Early risers will be able to spot Mars ???

? Every evening, the stars in the sky return to the same place 4 minutes early because the Earth's movement in its orbit around the sun gives us a slightly different background of stars each night. These 4 minutes represent the difference between the length of a day (24 hours) and that of an earth's rotation (23 hours and 56 minutes).

Here are 10 of the most famous night sky paintings that have ever been done by some of the most highly-celebrated artists in history. considered to be one of the most iconic Impressionist paintings from the era and features a sprawling depiction of the moon and stars stretched out over the small town of Saint-Remy-de-Provence in France

For time-lapse photography of the stars in the night sky, use an aperture of about f/5.6 if the moon is full, f/2.8 if the moon is not full. In manual exposure mode, shoot a test shot at 10 seconds. "I would always recommend using the manual exposure mode to avoid the exposure changing from one frame to the next which can cause an annoying
