The Tesla Roadster Energy Storage System (ESS) propulsion battery pack easily reaches a dangerous battery state (bricked) if the charge is either interrupted, or absent for any length of time. A typical Tesla Roadster battery can reach this state within a month or two dependent on last charge level.

This Battery Safety Module (BSM) is fundamentally a logic board also buried deep inside the ESS Main Battery Pack. Its function is to collect data about the health of the battery sheets and bricks, monitor vital safety functions such detecting water ingress, temperature, brick voltages, and is in constant communication with the PEM and VMS through a variety of safety interlocks.
