My original idea is using 6 regular AA batteries (1.5V each) to create 9V voltage supply for my device since it needs 9V-12V to operate. Later, I decide to upgrade my device to use solar panel so that my power unit looks nicer. I guess my goal here is to create a 9V power supply from the solar panel, and I already have a 2.5W solar panel in my

The first thing you need to decide is whether it will be manually turned on once power is lost, or whether it will be automatic. In expensive solar installations, when the loss of the grid is detected, it flips an automatic transfer switch that isolates the "critical load panel" (i.e. a second breaker box,) which is what the solar & batteries are connected to.

It only requires a constant 9V power supply (In the  
manual says so). So I have been using a 9V battery  
since, but it uses 98mA of current, therefore not  
suitable for small batteries. They can only supply  
150mAh. So, I decided to move to a cheap 9V AC  
adapter instead. The voltage was measured at  
9.15V and stable. Solar cell (8) Lennie (2
