Interphase regulation of graphite anodes is indispensable for augmenting the performance of lithium-ion batteries (LIBs). The resulting solid electrolyte interphase (SEI) is crucial in ensuring anode stability, electrolyte compatibility, and efficient charge transfer kinetics, which in turn dictates the cyclability, fast-charging capability, temperature tolerance, and safety of carbon anodes.

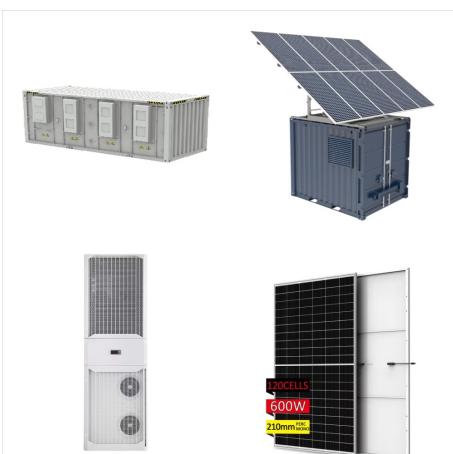

Previous lithium-air battery projects, typically using liquid electrolytes, made lithium superoxide (LiO_2) or lithium peroxide (Li_2O_2) at the cathode, which store one or two electrons per
