

What is a UPS? A UPS is a battery backup system that allows you to run your commercial electricity into the device and then to your computer systems. If the UPS detects that commercial power has been lost (or has become unreliable), it will instantly feed your computer system's power from the batteries.

In lighter loads, assuming a 200-250 watt draw between the monitor, keyboard, mouse, and computer, the UPS should last roughly 30-35 minutes. If you add in the networking gear, you're looking at about 15-20 minutes. If you want a longer run time or the ability to back up more devices, things get very expensive very quickly.

The main reason to get a UPS is that in the event of a power cut it gives you some time on battery power in order to save your files and then shut down your PC. Well a fuse popping is only going to cut power, so a UPS won't "protect it", because there's nothing to protect it against.

The notion behind a UPS is not to keep computing while the power is out. Instead, the UPS is designed to keep your basic computer components ??? the console and monitor ??? up and running just long enough for you to save your work and properly shut down the computer.

The best large UPS for a gaming PC must have enough juice to keep your gaming rig running long enough for you to save everything and shut it down safely. Therefore, we looked at the power capacity of each reviewed gaming PC UPS model, which is measured using the volt-ampere power output rating.

TL;DR: When you want a reliable UPS, APC is one of the top brands for the job, and its BR100MS2 is a fantastic UPS for home and office use has ten standard outlets with surge protection (six with battery backup) and USB-A and USB-C charge ports.
